TCWG Consideration Date

Project Description

The San Bernardino County Transportation Authority—in cooperation with the cities of Pomona, Montclair, Ontario, Rancho Cucamonga, and Fontana—proposes implementation of the West Valley Connector Project, a 35-mile-long bus rapid transit (BRT) project that will provide speed and quality improvements to the public transit system within the corridor and increase ridership. The proposed project is located primarily at the eastern end of Los Angeles County in the City of Pomona and at the southwestern end of San Bernardino County in the cities of Montclair, Ontario, Rancho Cucamonga, and Fontana. The proposed project alignment is generally running along Holt Boulevard/Avenue and Foothill Boulevard. The project limits are bounded on the north by Church Street, on the west by Main Street, on the east by Sierra Avenue, and on the south by Ontario International Airport (see Figure 1 and Figure 2). The project includes BRT stations at 33 locations/major intersections and associated improvements, premium transit service, Transit Signal Priority and queue jump lanes, dedicated lanes, and integration with other bus routes.

The project alignment consists of two phases. Phase I of the project would construct the “Milliken Alignment”, from the Regional Transit Center in Pomona to Victoria Gardens in Rancho Cucamonga. Phase II of the project would construct the “Haven Alignment”, from Ontario International Airport to Kaiser Permanente Medical Center in Fontana. The Phase I Milliken Alignment would be constructed first and is proposed to have 10-minute peak and 15-minute off-peak headways. Phase II is intended to be constructed immediately following the completion of Phase I, depending on the availability of funding, and is proposed to have 20-minute peak and 30-minute off-peak headways.

Several alternatives were considered during the project development phase of the project. A No Build Alternative and two build alternatives (Alternatives A and B) are being analyzed in the Environmental Assessment (see Figure 3):

- No Build Alternative – Involves no improvements to existing bus services, which maintain current service of 15-minute headways (total of four buses per hour in each direction) along Routes 61 and 66.
- Build Alternative A – Full BRT corridor with 60 side-running stations at 33 locations/major intersections. No dedicated bus-only lanes.
- Build Alternative B – Full BRT with Dedicated Bus-only lanes in Ontario. With exception to the 3.5-mile Dedicated Bus-only lanes in Ontario, the remainder of “Alternative B” is identical to “Alternative A”. Within the 3.5-mile Dedicated Bus-only segment proposed for “Alternative B”, “Alternative A” plans for side running stations instead of center running stations. The dedicated lanes would include two mixed-flow lanes and one transit lane in each direction. To accommodate the dedicated lanes, roadway widening, and additional utilities, this alternative requires permanent and temporary right-of-way acquisitions.

Type of Project Bus, rail, or inter-modal facility/terminal/transfer point.
--

County San Bernardino	Narrative Location/Route & Postmiles From the Metrolink station on S Garey Ave in Pomona, extending eastward along Holt Ave/Blvd to the Ontario Airport, then along Foothill Blvd through Rancho Cucamonga to Sierra Ave in Fontana, turning south and terminating at Kaiser Permanente Medical Center in Fontana.

Project Purpose and Need (Summary):				
<p>The purpose of the proposed project is to improve corridor mobility and transit efficiency in the San Bernardino Valley from the City of Pomona to the City of Fontana with an enhanced, state-of-the-art BRT system. The proposed project would address the growing traffic congestion and travel demands of the one million people that would be added to San Bernardino County by 2030. Improved rapid transit along the project corridor would help SBCTA/Omnitrans achieve its long-range goals to cost effectively enhance lifeline mobility and accessibility, improve transit operations, increase ridership, support economic growth and redevelopment, conserve nonrenewable resources, and improve corridor safety.</p>				
<p>Recognizing the importance of the West Valley Connector transit corridor, SBCTA proposes a project that is designed to achieve the following objectives:</p> <ul style="list-style-type: none"> • Improve transit service by better accommodating high existing bus ridership. • Improve ridership by providing a viable and competitive transit alternative to the automobile. • Improve efficiency of transit service delivery while lowering Omnitrans' operating costs per rider. • Support local and regional planning goals to organize development along transit corridors and around transit stations. 				
<p>The project purpose and objectives stated above would respond to the following needs:</p> <ul style="list-style-type: none"> • Current and future population and employment conditions establish a need for higher-quality transit service. • Current and future transportation conditions establish a need for an improved transit system. • Transit-related opportunities exist in the project area. 				
Surrounding Land Use/Traffic Generators (especially effect on diesel traffic)				
<p>The 35-mile project corridor transects portions of the cities of Pomona, Montclair, Ontario, Rancho Cucamonga, and Fontana. These municipal areas are characterized by various types of land uses and traffic generators. The corridor includes areas of substantial residential, retail, commercial, medical, and industrial land uses as well as the Ontario International Airport.</p>

Opening Year: If facility is an interchange(s) or intersection(s), Build and No Build cross-street AADT, % and # trucks, truck AADT

The proposed project is not an interchange or intersection, and therefore these data are not applicable.

RTP Horizon Year / Design Year: If facility is an interchange (s) or intersection(s), Build and No Build cross-street AADT, % and # trucks, truck AADT

The proposed project is not an interchange or intersection, and therefore these data are not applicable.

Describe potential traffic redistribution effects of congestion relief (*impact on other facilities*)

The proposed project would improve overall performance and reduce congestion within the project limits by providing a transportation mode alternative to passenger vehicles. The project will encourage patrons to use the BRT service instead of operating passenger vehicles, thereby reducing traffic volumes throughout the project corridor. The project will not result in additional diesel vehicle trips or passenger vehicle trips. Improved rapid transit along the project corridor would enhance lifeline mobility and accessibility, improve transit operations, increase ridership, and improve corridor safety.

Comments/Explanation/Details (attach additional sheets as necessary)

Under 40 CFR 93.123(b)—PM₁₀ and PM_{2.5} Hot Spots—the following criteria are utilized to determine the potential for a proposed project to qualify as a Project of Air Quality Concern.

- (i) *New highway projects that have a significant number of diesel vehicles, and expanded highway projects that have a significant increase in the number of diesel vehicles;*

As shown in the tables above, the proposed project is a BRT project that would not result in a significant increase in the number of diesel vehicles along the 33.5-mile-long project corridor. There is no increase in daily truck traffic associated with implementation of the proposed project. Therefore, the proposed project would not result in a significant increase in the number of diesel vehicles and would not be considered a Project of Air Quality Concern under this criterion.

- (ii) *Projects affecting intersections that are at Level-of-Service D, E, or F with a significant number of diesel vehicles, or those that will change to Level-of-Service D, E, or F because of increased traffic volumes from a significant number of diesel vehicles related to the project;*

The proposed project will not increase the number of diesel vehicles on the road. Therefore, the proposed project would not be considered a Project of Air Quality Concern under this criterion.

- (iii) *New bus and rail terminals and transfer points that have a significant number of diesel vehicles congregating at a single location;*

The proposed project would not implement a new bus or retail terminal or transfer point at which diesel vehicles would be congregating. Therefore, the proposed project would not be considered a Project of Air Quality Concern under this criterion.

- (iv) *Expanded bus and rail terminals and transfer points that significantly increase the number of diesel vehicles congregating at a single location; and*

The proposed project does not involve expansion of a bus or rail terminal or transfer point. Therefore, the proposed project would not be considered a Project of Air Quality Concern under this criterion.

- (v) *Projects in or affecting locations, areas, or categories of sites which are identified in the PM10 or PM2.5 applicable implementation plan or implementation plan submission, as appropriate, as sites of violation or possible violation.*

The proposed project is not in or affecting a site of PM₁₀ or PM_{2.5} air quality standard violation. Therefore, the proposed project would not be considered a Project of Air Quality Concern under this criterion.

West Valley Connector Corridor Bus Rapid Transit Project

Supplemental Traffic Analysis

June 2022

1.0 PURPOSE OF THIS DOCUMENT

The Traffic Operations Analysis Report and Operations and Maintenance Facility Traffic Analysis Report for the West Valley Connector Corridor (WVCC) Bus Rapid Transit (BRT) Project were prepared in 2018 in support of the Final Environmental Impact Report (EIR) and the Environmental Assessment (EA) for the project. Since the certification of the Final EIR by the San Bernardino County Transportation Authority (SBCTA) Board and the issuance of the Finding of No Significant Impact (FONSI) by the Federal Transit Administration (FTA) in May 2020, changes have occurred to the Project. The purpose of this Supplemental Operations and Maintenance Facility Traffic Analysis is to assess whether there are any new traffic impacts that would result due to changes to the project.

2.0 BACKGROUND

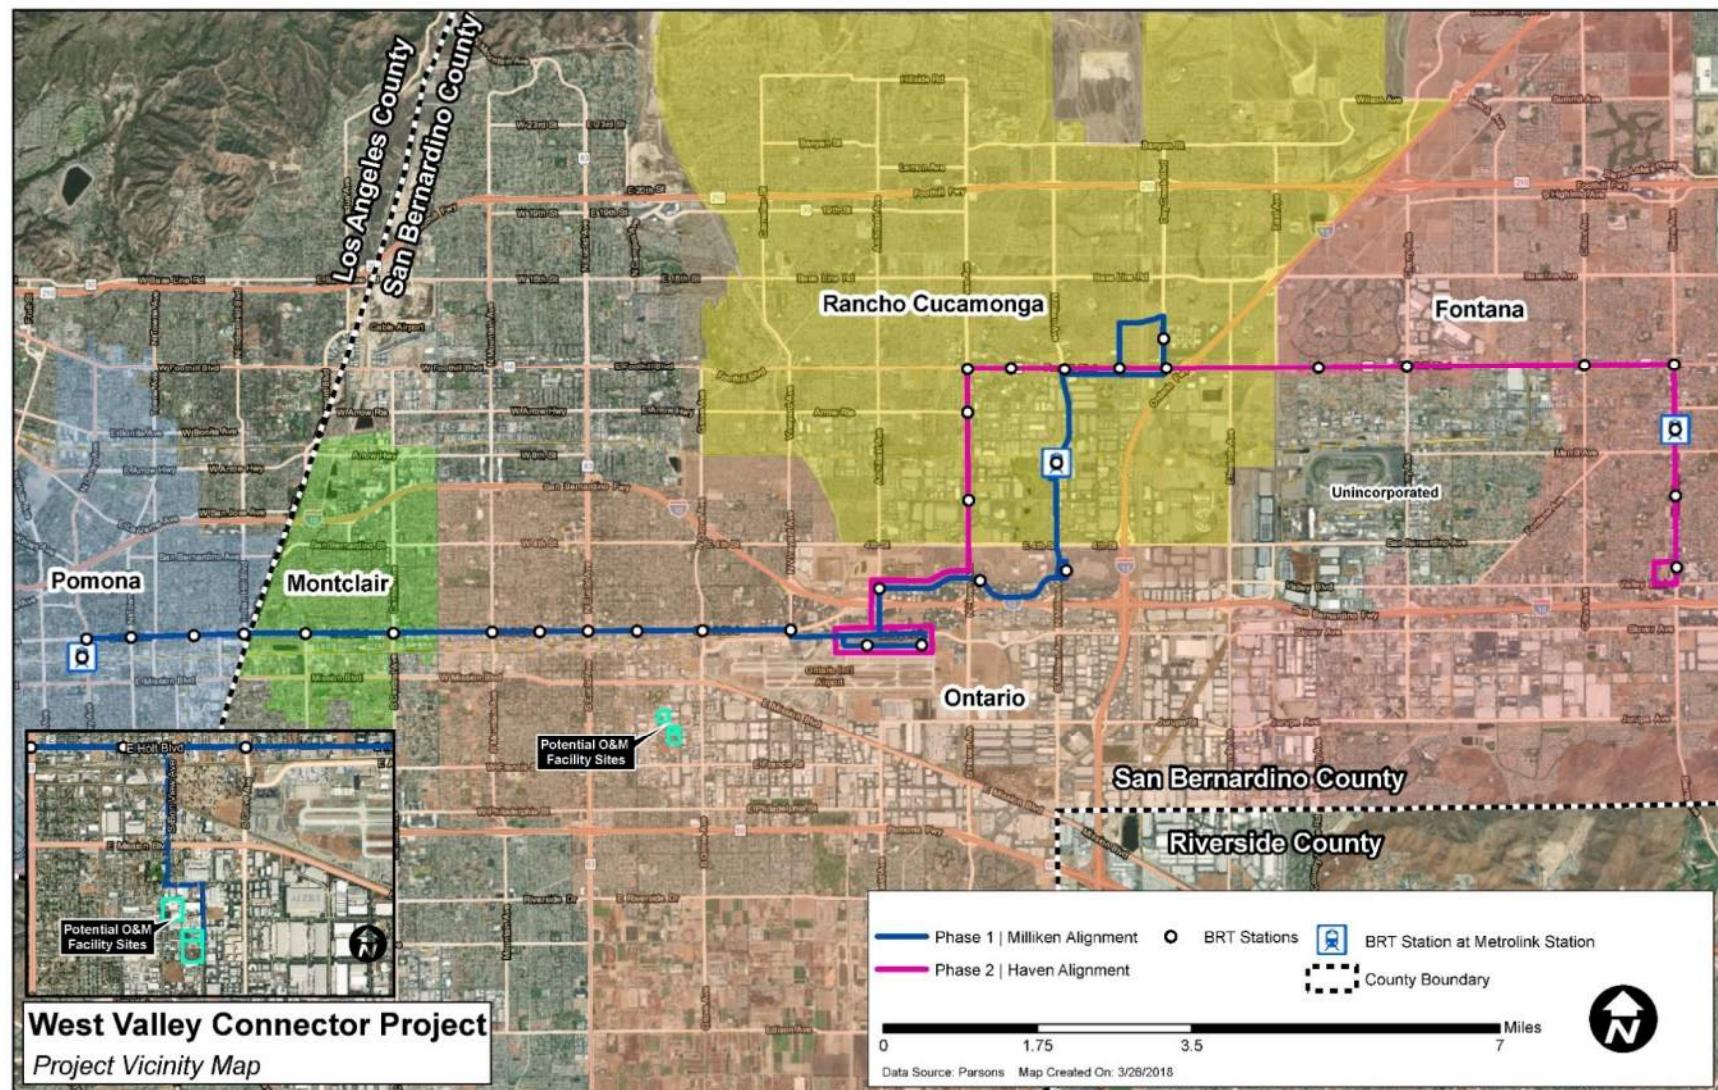

The SBCTA, in cooperation with the cities of Pomona, Montclair, Ontario, Rancho Cucamonga, and Fontana, proposes construction of the 35-mile-long WVCC Project, which would decrease travel times and improve the existing public transit system within the corridor.

The project includes up to 60 station platforms at 33 locations/major intersections and associated improvements. The environmental review process for the project was completed in accordance with California Environmental Quality Act (CEQA) and National Environmental Policy Act (NEPA) requirements. The Final EIR under CEQA and FONSI under NEPA were completed in March 2020. The SBCTA and the participating cities identified Alternative B (Full BRT with 3.5 miles of dedicated bus-only lanes on Holt Boulevard in Ontario) as the preferred alternative. The SBCTA Board certified the Final EIR in May 2020, and FTA issued a FONSI for the project shortly after the Final EIR was certified. Figure 1 presents the original project map.

Description of the Preferred Alternative (Alternative B)

Alternative B, the Preferred Alternative, includes the full 35-mile-long BRT corridor, which is composed of the Phase I/Milliken Alignment, Phase II/Haven Alignment, 3.5 miles of dedicated bus-only lanes in Ontario, and 5 center-running stations and 50 side-running stations at up to 33 locations/major intersections.

Figure 1. WVCC BRT Original Project Map (Final EIR/FONSI, March 2020)

The dedicated lanes segment includes 2 mixed-flow lanes and 1 transit lane in each direction and 5 center-running stations. To accommodate dedicated lanes, right-of-way acquisition and temporary construction easements are required for roadway widening and placement of electrical and fiber optic utility lines. This process is currently ongoing and is scheduled to be completed by late 2022. Land acquisition along the corridor will also accommodate roadway reconfiguration and station construction. In addition, some areas of the project corridor involve relocation or extension of adjacent driveways, curbs, medians, sidewalks, parking lots, and local bus stops.

The project would be constructed in two phases: Phase I/Milliken Alignment, from the Pomona Regional Transit Center to Victoria Gardens in Rancho Cucamonga, and Phase II/ Haven Alignment, from Ontario International Airport to Kaiser Permanente Medical Center in Fontana. Phase I is scheduled for completion in late 2024. Construction of the Phase II/ Haven Alignment is scheduled to occur after completion of Phase I when funding is available.

The project's bus fleet would be composed of 60-foot-long articulated compressed natural gas (CNG) propulsion buses. A new operations and maintenance (O&M) facility for light maintenance activities would be constructed as part of the project during the Phase I/Milliken Alignment. As part of the environmental analysis, three potential sites in Ontario were considered for the proposed new O&M facility, with Site 3, a parcel owned by the City of Ontario (1333 S. Bon View Avenue), selected as the preferred site through the CEQA/NEPA process.

3.0 CHANGES TO PROJECT

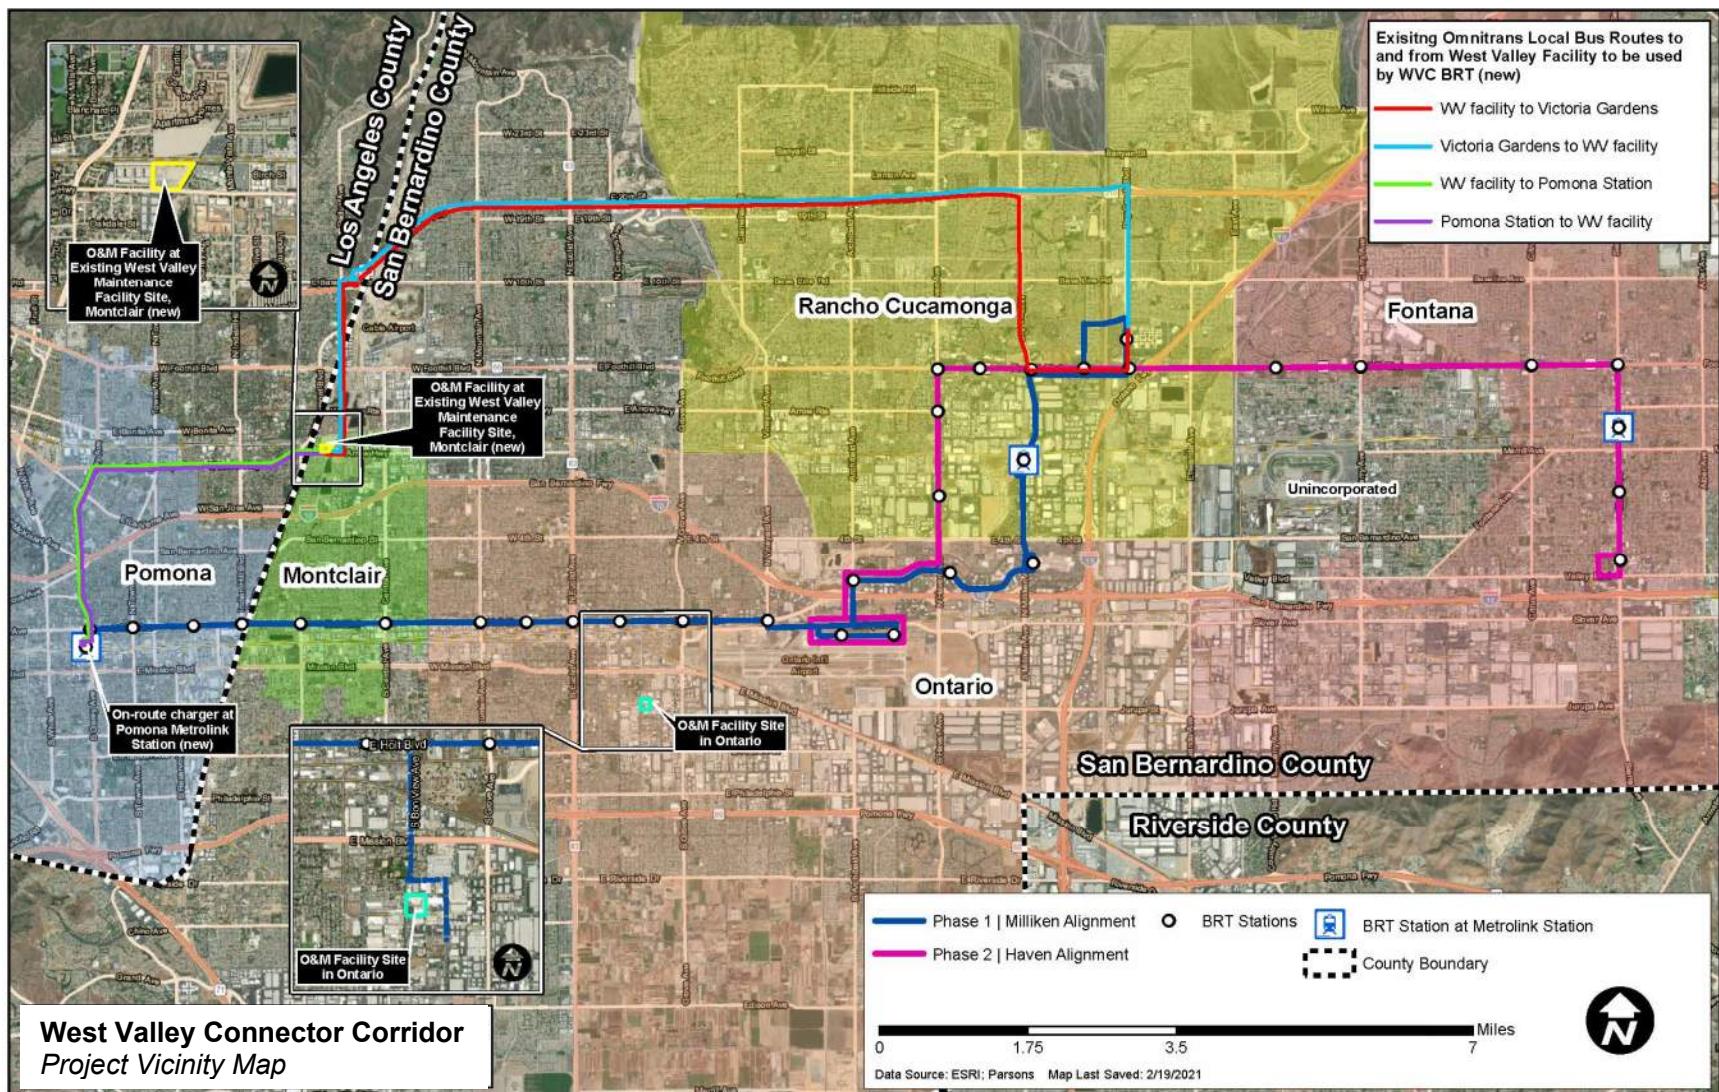

Subsequent to environmental approval of the WVCC Project in 2020, as described earlier, the SBCTA proceeded with project design of the Phase I/Milliken Alignment. To deliver the most cost-effective project, the SBCTA has continued to review the project for savings. Subsequently, the SBCTA has identified changes that could be implemented to help achieve significant cost savings and also meet California's health-based air quality standards and greenhouse gas emission reduction goals while adhering to the project's purpose and need.

The following paragraphs and Figure 2 summarize the proposed changes to the WVCC project description stated in the Final EIR/FONSI (March 2020).

3.1 Change in Bus Type and Length

The SBCTA had identified the use of 40-foot-long buses over the 60-foot-long CNG buses (proposed in the environmental document) as one of the opportunities for savings. Based on the evaluation, the SBCTA determined that the seated passenger capacity of the 40-foot and 60-foot buses is similar and can accommodate ridership projections for the project. Design adjustments can be incorporated that allow for the loading of bikes on the front of the 40-foot bus as opposed to bringing them onto 60-foot buses. In addition, a 3-door, 40-foot bus is available that will serve the planned center platforms along Holt

Figure 2. WVCC BRT Proposed Changes

Boulevard. Finally, the center platform can be designed in such a way that it could accommodate 60-foot buses in the future, both from a platform length and platform height perspective. Therefore, the use of 40-foot-buses can still meet the high-quality transit system and the projected demand as stated in the purpose and need of the project.

As the final design proceeded, the SBCTA recently received a Transit and Intercity Rail Capital Program (TIRCP) funding award of \$15 million administered by the California State Transportation Agency (CalSTA), for the purchase of zero-emission battery electric buses (BEB) for the WVCC Project. The use of BEBs would also help the SBCTA to meet the State Zero-Emission Vehicle (ZEV) program aimed at reducing air pollutant and greenhouse gas emissions. Due to the unavailability of the 60-foot-long BEBs, the SBCTA decided to purchase 18 of the 40-foot-long BEBs as part of Phase I operations to take advantage of available grant funding. To maintain future flexibility, the WVCC stations are being designed to accommodate the use of both 40-foot-long and 60-foot-long buses.

3.2 Change in O&M Facility and Charging Infrastructure

The Omnitrans recently implemented the Connect Forward service reduction plan at its West Valley Vehicle Maintenance Facility (WVVMF), located at 4748 E. Arrow Highway, Montclair (Figure 3), which reduces the number of fixed route buses in service thus freeing up capacity. The SBCTA, working in partnership with the Omnitrans, has identified that the 18 bus fleet required for Phase I operations can be serviced at the WVVMF. The use of the Omnitrans' existing facility provides cost savings opportunity by deferring the construction of the new O&M facility at 1333 S. Bon View Avenue in Ontario until funding is available or when the bus fleet is expanded as part of the Phase II/Haven Alignment operations. Other than the phasing, there are no additional changes to the new O&M facility in Ontario (e.g., description, anticipated impacts or previous mitigation pertaining to the new O&M facility).

To use the existing WVVMF site in Montclair as an O&M facility to service the BEBs for the WVCC Project, some retrofits would be required, including electrical infrastructure upgrades and installation of charging stations within the facility's premises (Figure 4). The use of BEBs would also require installation of on-route chargers at the Pomona Transit Center Station located at the Pomona Transit Center/Metrolink station area (Figure 5). However, there would be no change to the footprint of either facility. Installation of the on-route chargers would occur concurrently with the WVCC Project's station construction program. No additional property acquisition is required to convert the existing WVVMF in Montclair to handle the O&M needs associated with implementation of the WVCC Project.

The BRT buses accessing the proposed O&M site in Montclair are expected to follow the current routes used by Omnitrans' local buses. Except for the proposed changes outlined above, all other WVCC Project elements as described in the 2020 Final EIR/FONSI would remain the same.

Figure 3. Aerial View of Existing Omnitrans West Valley Vehicle Maintenance Facility

Figure 4. O&M Facility Conceptual Site Plan at WVVMF

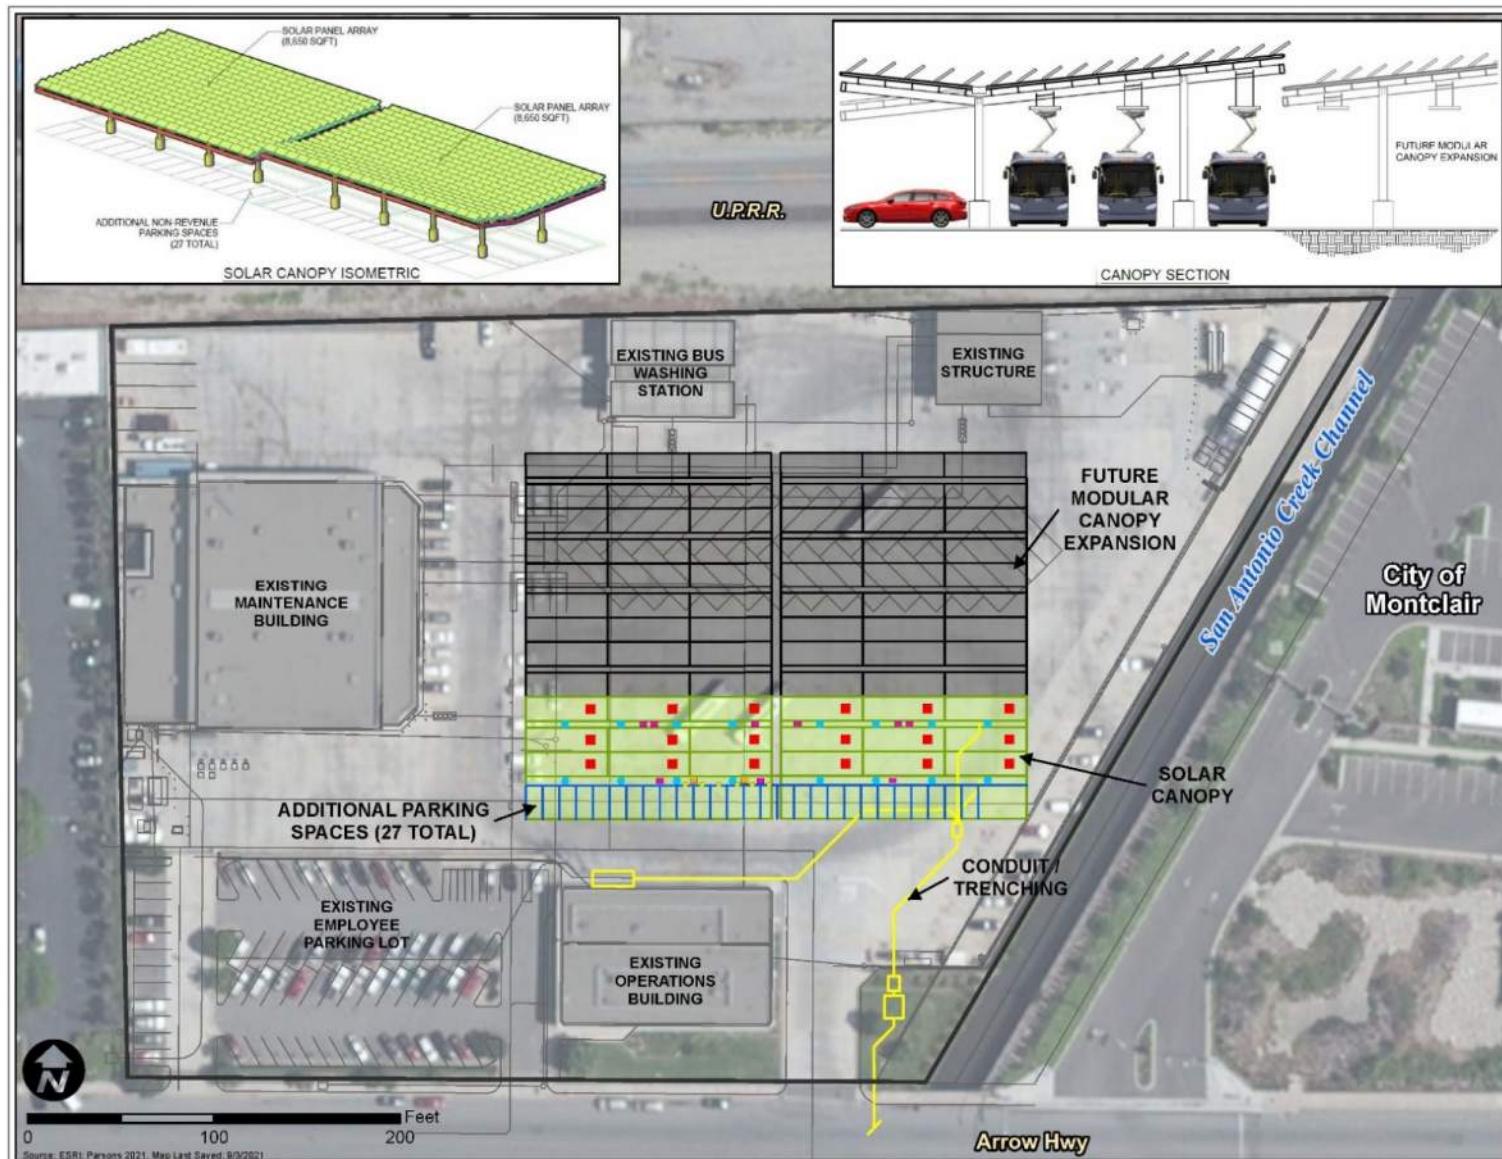

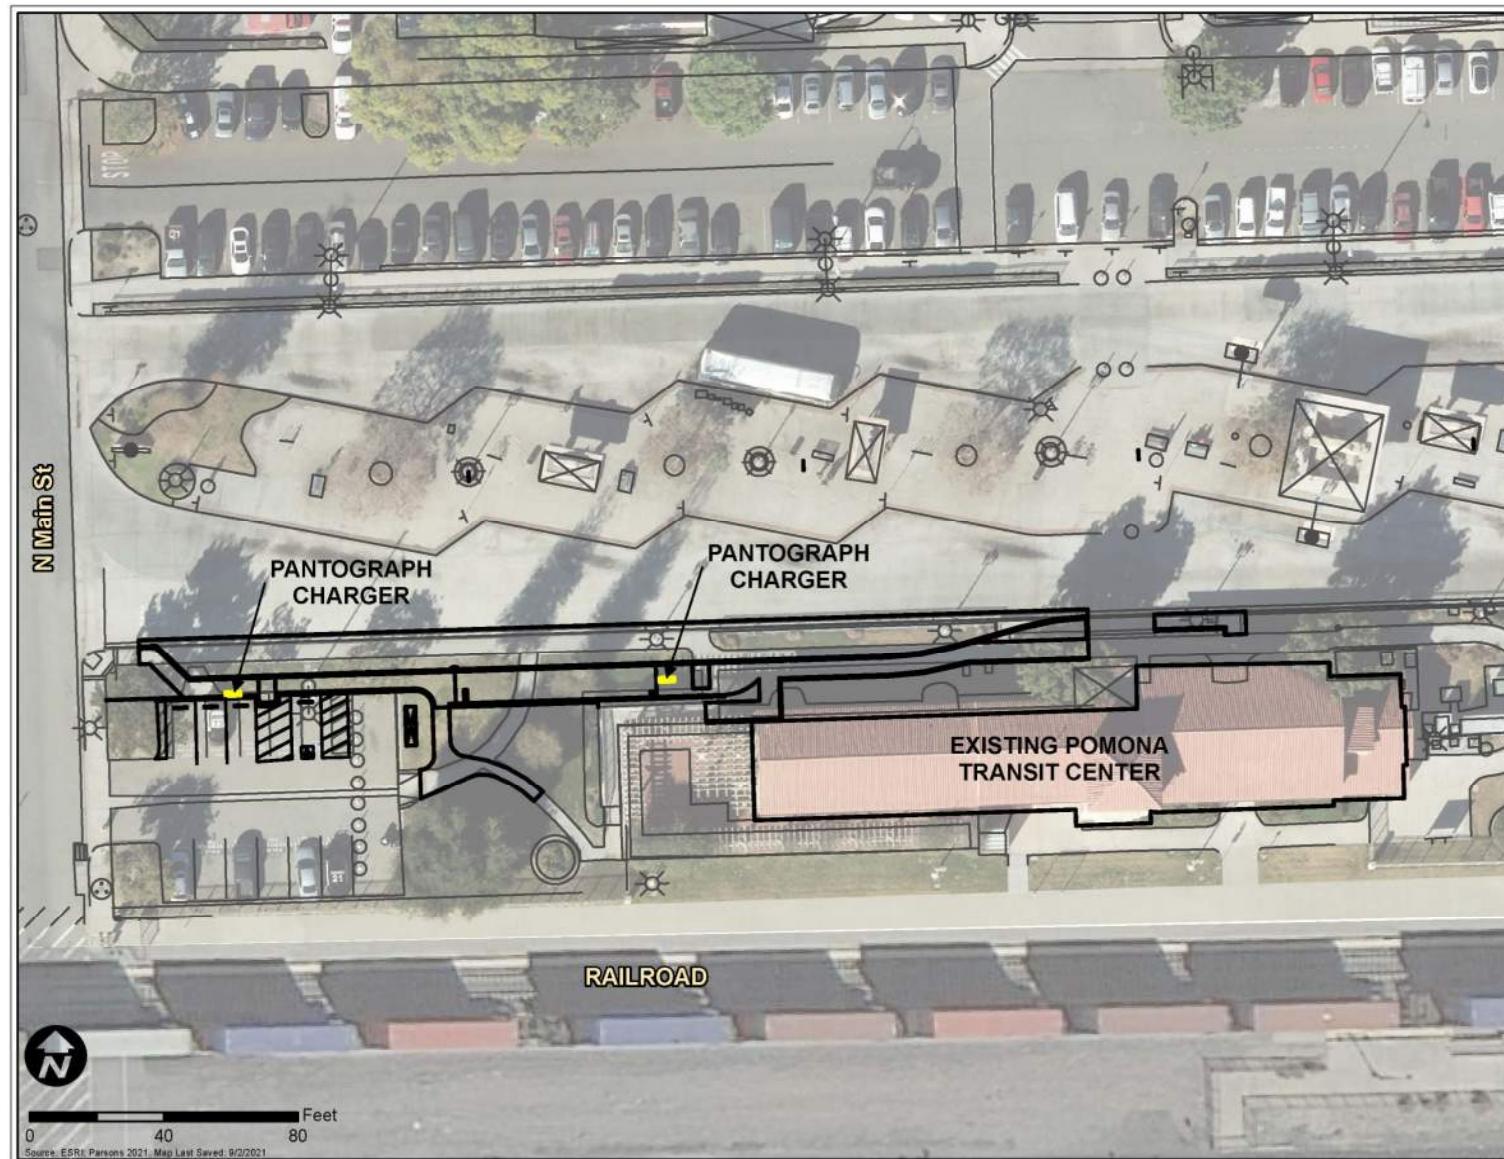

Figure 5. Two Chargers to be Installed at Pomona Transit Center Station

Proposed New Use of WVVMF

Conversion of the existing WVVMF to support O&M functions of the WVCC Project requires changes to the facility. The BEB parking and charging stations would be located at the open paved area at the central section of the WVVMF site, while parking spaces for employee and visitor vehicles would be located just north of the office building area (see Figure 4). BEB charging areas would consist of three rows and be covered by a solar canopy supported by concrete columns and located immediately to the north of the new vehicle parking spaces. Nine 150-kilowatt electric bus chargers and two 150-kilowatt electric vehicle chargers would be provided under this canopy. The remaining area between the proposed charging areas and the existing bus wash facility and fueling station to the north would continue to be used for bus parking. Underground conduits would extend from the charging area to the battery backup, switchboard, transformer, and the power line service connection at Arrow Highway.

On-Route Charger

The use of 40-foot BEBs will also require the installation of on-route chargers at the Pomona Transit Center Station. The installation of on-route chargers will occur within the existing footprint of the original proposed station to be located within the Pomona Transit Center Station (see Figure 5), and the area and depth of which has been previously disturbed.

Construction Activities

Modification of the existing Montclair WVVMF to support the BEB maintenance would occur as part of the Phase I/Milliken Alignment construction, which would start in March 2023 and be completed in late 2024. Installation of the on-route chargers at the Pomona Transit Center Station would occur at the same time as the WVCC Project construction.

Construction activities at the WVVMF site would include mobilization and staging, site clearing, grading and paving, charging structure construction, equipment installation, and minor landscaping and finishing. The charging structure would require soil excavation of approximately 15 feet below existing ground surface, subject to the verification of the geotechnical investigation. Trenching for electrical and communication equipment, and if any wet or dry utility relocations are needed, would have an excavation depth of approximately 6 feet.

Construction activities at the Pomona Transit Center Station would include installation of two electric pantograph chargers. The maximum excavation depth for these chargers is 10 feet.

In all, ground disturbance is limited to the above described locations. No extensive backfill or grading are expected given the relatively flat elevation of the project site.

On-site Operational Activities

BEB buses would be parked, charged, and maintained at the Omnitrans WVVMF. A total of nine 150- kW chargers would be installed at the WVVMF, two of which would be reserved for future uses. Bus charging would likely occur during the nighttime.

A total of 48 new employees would be added to the site, aside from the existing 157 employees of the facility. The operating hours of the facility are currently from 3:00 a.m. to 11:30 p.m. for operations and from 5:30 a.m. to 2:30 p.m. for maintenance, every day except for select holidays.

Implementation Schedule

The implementation schedule has been updated as follows:

- Completion of the environmental compliance phase (March 2020)
- Completion of Final Design (December 2022) and begin construction in March 2023
- Completion of Phase I/Milliken Alignment and O&M facility construction in October 2024
- Completion of vehicle procurement and system testing in December 2024
- System operation in February 2025

Construction of Phase II/Haven Alignment is scheduled to occur after completion of the Phase I/Milliken Alignment pending funding availability.

4.0 CHANGES IN ENVIRONMENTAL SETTING

The changes to the WVCC Project include additional transportation-related facilities to be constructed at the existing Omnitrans' WVVMF and the existing Pomona Transit Center Station. The Pomona Transit Center Station is the location of one of the BRT stations included in the WVCC Project. The on-route chargers would be installed within an area of pavement and ornamental landscaping within the southern portion of the Pomona Transit Center Station.

The Omnitrans WVVMF occupies approximately 5.3 acres and currently operates as a terminal and service facility for Omnitrans buses. The facility includes an office building at the southeastern section, a surface parking lot for employees at the southwestern section, repair shop and storage at the western section, bus wash facility at the northern section, fueling station at the northeastern section, aboveground storage tanks and parking spaces along the eastern edge, and bus parking areas at the central section.

An access driveway is located at the southeastern corner and the site is surrounded by block walls and wrought iron fence on the south (Arrow Highway), block walls on the north and west, and a chain-link fence on the east. An aerial view of the existing Omnitrans WVVMF and its vicinity is shown in Figure 3.

The following describes the characteristics/configurations of key roadways in the study area in the vicinity of the WVVMF:

- Monte Vista Avenue, oriented in a north-south direction, is a six-lane divided roadway north of Arrow Highway and is a four-lane divided roadway south of Arrow Highway. Monte Vista Avenue provides direct access to Interstate (I) 10 on the south and indirect access to SR-210 via Base Line Road.

- Arrow Highway is a four-lane divided roadway, oriented in an east-west direction, in the vicinity of the WVVMF. The posted speed limit is 45 miles per hour.
- Base Line Road is a four-lane divided roadway, oriented in an east-west direction, providing access to State Route (SR) 210 east of Monte Vista Avenue. The roadway includes bicycle lanes in each direction and consists of a 45 miles per hour posted speed limit.
- Garey Avenue is a four-lane divided roadway, oriented in a north-south direction, providing access to I-10 on the south. The posted speed limit on Garey Avenue is 40 miles per hour in the vicinity of Arrow Highway.

5.0 CHANGES IN REGULATORY SETTING

No changes to the regulatory setting pertaining governing traffic operations and transportation analysis has occurred since the preparation of the Final EIR/FONSI.

6.0 IMPACTS OF PROJECT CHANGES

Change in Opening Year

The change in opening date from 2023 to 2025 would not change the results of the traffic impact analysis prepared for Phase I and Phase II implementation. The project's incremental effects (i.e., new vehicle trips generated) would remain the same in opening year 2025, as only the "no project" background traffic volumes would be anticipated to increase slightly.

Relocation of O&M Facility Site

The analysis of project changes focuses on potential near-term traffic impacts to three key intersections along the route(s) to/from the WVVMF. The three intersections selected as locations of potential traffic impacts are:

- Garey Avenue/Arrow Highway (City of Pomona)
- Monte Vista Avenue/Base Line Road (City of Claremont)
- Monte Vista Avenue/Arrow Highway (City of Montclair)

These intersections were selected for this analysis due to the fact that they are significant intersections along the bus routes to/from, and in near vicinity of, the WVVMF site. Further, these are locations where turning movements of new bus and passenger vehicle trips would occur (as opposed to through movements only). Turning movements, especially left-turn movements, have lower capacities than through movements. Therefore, additional trips to turning movements have the potential to result in greater impacts than additional trips to through movements. The intersection locations are shown in Figure 6.

Figure 6. Study Intersection Locations

Existing peak period traffic counts were acquired at each location from historical count data, in lieu of collecting new counts during the Covid-19 pandemic. The historical counts were adjusted to account for traffic growth, in order to develop a 2020-equivalent existing scenario. Traffic count data is provided in Attachment A.

Based on the traffic count data, the existing peak hour levels of service at the study intersections are summarized in Table 1. Detailed LOS calculation sheets are provided in Attachment B.

Table 1 – Existing Conditions Peak Hour Intersection LOS

Intersection		Jurisdiction	AM Peak Hour		PM Peak Hour	
			Delay (s)	LOS	Delay (s)	LOS
1	Garey Avenue/Arrow Highway	Pomona	27.5	C	33.1	C
2	Monte Vista Avenue/Base Line Road	Claremont	34.8	C	52.4	D
3	Monte Vista Avenue/Arrow Highway	Montclair	26.9	C	34.4	C

As shown in Table 1, the key study intersections in the vicinity of the existing WVVMF site are currently operating at LOS D or better during peak hours, which is considered acceptable LOS within the three jurisdictions.

Based on the bus schedules and number of new employees (operators and maintenance staff) on site, the daily, peak hour, and off-peak period vehicle trip generation calculations were estimated. The bus operators are assumed to arrive at and depart from the facility outside of peak hours due to the bus route run time. The trip generation estimates are shown in Table 2.

Table 2 – O&M Facility Trip Generation

Trip Generation Component		AM Peak Hour Trips			PM Peak Hour Trips			Off-Peak Hour Trips			Daily Trips
		In	Out	Total	In	Out	Total	In	Out	Total	
Staff	Maintenance/Mechanics Staff	6	0	6	0	6	6	2	2	4	16
	Bus Operators	0	0	0	0	0	0	40	40	80	80
Bus	Bus Trips	0	0	0	0	0	0	24	24	48	48
	Bus Trips PCE-adjusted (3.0 factor)	0	0	0	0	0	0	72	72	144	144
Total (PCE-adjusted trips)		6	0	6	0	6	6	114	114	228	240

PCE = Passenger car equivalent

As shown in Table 2, the change in project description is forecast to generate 240 new PCE-adjusted daily trips at the WVVMF. However, the majority of new vehicle trips are anticipated to occur outside of peak periods.

Using the trip generation described and assuming a trip distribution of employee trips along major streets within the vicinity of the WVVMF, new trips were assigned to the study intersections to derive an existing plus project condition. The existing plus project peak hour levels of service at the study intersections are summarized in Table 3. Detailed LOS calculation sheets are provided in Attachment B.

Table 3 – Existing Plus Project Conditions Peak Hour Intersection LOS

Intersection		Jurisdiction	AM Peak Hour		PM Peak Hour	
			Delay (s)	LOS	Delay (s)	LOS
1	Garey Avenue/Arrow Highway	Pomona	27.5	C	33.3	C
2	Monte Vista Avenue/Base Line Road	Claremont	34.9	C	52.8	D
3	Monte Vista Avenue/Arrow Highway	Montclair	26.9	C	34.4	C

As shown in Table 3, with the addition of new peak hour trips associated with the WVVMF, the study intersections in the vicinity of the proposed O & M facility at the WVVMF site are forecast to continue to operate at LOS D or better. While the three intersections are only a sub-set of the intersections affected by new vehicle trips, the limited changes in vehicle delay at these three intersections can generally be assumed to be representative of the effects at other intersections within the vicinity. Thus, modifications to the proposed project are not anticipated to result in any additional impacts at these intersections.

Since the operation and maintenance of the O&M facility in Ontario and Montclair are of similar in nature and both are located within the vicinity of the proposed corridor alignments, no significant change to Vehicle Miles Traveled (VMT) within the overall study area is anticipated.

Finally, relocation of the O&M facility from Ontario to Montclair would not result in additional impacts to intersections along the main project alignment. It should be noted that because there will be no construction and implementation of the O&M facility in Ontario during the Phase I/Milliken Alignment implementation, impacts at the following intersections will not occur because of the project implementation as predicted in the 2018 Operations and Maintenance Facility Traffic Analysis Report.

- #2 Campus Avenue/Belmont Street (years 2025 and 2040)
- #4 Bon View Avenue/Belmont Street (years 2025 and 2040)
- #6 Grove Avenue/Mission Boulevard (year 2040)

7.0 CONCLUSION

Iteris reviewed the potential traffic impacts of changes in the project description, which includes use of the existing WVVMF, located at 4748 E Arrow Highway in Montclair, instead of the construction of a new facility. The analysis focused on traffic impacts to three significant intersections along the route(s) to/from the existing facility.

Based on the anticipated trip generation and trip distribution of peak hour traffic at the facility, no new traffic impacts are anticipated to occur at the key intersection locations. This result at key locations is assumed to be generally representative of the effects at other locations in the vicinity. Thus, modifications to the proposed project are not anticipated to result in any additional impacts at these intersections.

Since the operation and maintenance of the O&M facility in Ontario and Montclair are similar in nature and both are located within the vicinity of the proposed corridor alignments, no significant change to Vehicle Miles Traveled (VMT) within the overall study area is anticipated.

Finally, relocation of the O&M facility from Ontario to Montclair would not result in additional impacts to intersections along the main project alignment. It should be noted that because there will be no construction and implementation of the O&M facility in Ontario during the Phase I/Milliken Alignment implementation, impacts at the following intersections will not occur because of the project implementation as predicted in the 2018 Operations and Maintenance Facility Traffic Analysis Report.

- #2 Campus Avenue/Belmont Street (years 2025 and 2040)
- #4 Bon View Avenue/Belmont Street (years 2025 and 2040)
- #6 Grove Avenue/Mission Boulevard (year 2040)

8.0 CHANGES TO MITIGATION MEASURES

Because the changes to the project would not introduce any new traffic impacts to the main alignment during the Phase I/Milliken implementation and to the area in general vicinity of the new O&M facility in Montclair, no additional mitigation measures would be required.

Because there will be no construction and implementation of the O&M facility in Ontario during the Phase I/Milliken Alignment implementation, the following mitigation measure to minimize impacts at the Grove Avenue/Mission Boulevard intersection by the year 2040 will not be required:

- Modify the traffic signal to include a right-turn overlap phase at the westbound Mission Boulevard approach (Year 2040)

The 2018 Operations and Maintenance Facility Traffic Analysis Report indicated that no feasible mitigation measures are available to mitigate the impacts at Campus Avenue/Belmont Street and Bon View Avenue/Belmont Street intersections. Therefore, the relocation of the O&M facility from Ontario to Montclair would result in beneficial

impacts and would not require further coordination with local jurisdictions to identify appropriate traffic improvement compensation for these two intersections.
